

Data Sources

This appendix documents the data sources used to describe the implementation and context of New Hope and the use of benefits and services. Table A.1 lists the samples for whom data were collected.

- **Field Research.** MDRC staff observed New Hope program operations and interviewed participants, project representatives, and program managers. Information was collected about a range of issues, such as history of the program, recruitment strategies, program operations, and support available to participants. Materials gathered in these visits were used throughout the report, but particularly in Chapters 2, 5, and 7.
- Baseline Data. Baseline characteristics were collected for all program and control group members using the Background Information Form (BIF) and the Private Opinion Survey (POS). The BIF was the primary source of data on baseline characteristics. In addition, the POS elicited applicants' attitudes and opinions on their work experience and related obstacles and aids to obtaining or retaining employment. Both the BIF and POS were completed prior to random assignment. These data were used in Chapter 6.
- New Hope Management Information System (MIS) Data. The New Hope MIS database contains information on baseline characteristics for the full sample and tracks all program group members. It provides data on the use of benefits and community service jobs (CSJs) for all participants in New Hope. For this report, 12 months of follow-up data are available for those randomly assigned from the start of random assignment (August 1994) through August 31, 1995. The outcomes for this early cohort are presented in Chapter 9.
- Focus Groups. MDRC staff conducted focus groups in October 1995 with 36 New Hope participants, who were selected based on a random sample of 100 program group members who had been in the program for at least three months. The purpose of the focus groups was to learn about participants' experiences in the program, as well as to provide an opportunity for participants to assess New Hope's impact on their lives. Data gathered in these focus groups were used in Chapter 7. (See also the MDRC working paper, Participants in the New Hope Demonstration Discuss Work, Family, and Self-Sufficiency, by Dudley Benoit, 1996.)
- Neighborhood Survey. From December 1995 to June 1996, an in-person survey was conducted in the Northside and Southside neighborhoods from which New Hope candidates were recruited. A random sample of 900 dwelling units (500 on the Northside and 400 on the Southside) were selected to be surveyed. Of these, 719 surveys (80 percent) were completed, 380 on the Northside and 339 on the Southside. The purpose of the survey was to

		Total respondents Northside Southside	719 380 339		

NOTES: ^aFive of the 1,362 randomly assigned sample members were subsequently dropped from the analysis because of missing baseline forms (BIFs). ^bCompletion of the POS was voluntary. POS responders were 79 percent of the total sample.

determine the characteristics of households residing in the target neighborhoods, what proportion of neighborhood residents were potentially eligible for New Hope, and whether residents had heard about the program and factors associated with applying to the program. These data were used in Chapter 4. (In addition, Appendix D describes the survey methodology in detail.)

• Program Documents and Published Materials. Labor market information was compiled using a variety of sources. Data on job openings in the Milwaukee SMSA were obtained from reports published by the Employment and Training Institute (ETI) of the University of Wisconsin-Milwaukee. ETI also provided special runs of the survey data file. The U.S. Bureau of Labor Statistics and the Wisconsin Department of Workforce Development provided statistics on unemployment rates. Calculations on the amount of time needed to travel to jobs by bus were made using data provided by the Milwaukee County Transit System Transit Guide for 1995. These data were used in Chapter 3.

Data on the human service providers available in Milwaukee County were compiled using resource directories from three organizations: Helpline Information and Referral Directory, Lincoln Park Community Service Support Directory 1995–1996, and the Milwaukee Public Library T.A.P. Into Tutoring Guide (1995). New Hope staff reviewed the information. These data were used in Chapters 3 and 5.

Various New Hope program documents were used throughout the report, but particularly in Chapters 3, 5, and 7. These include "community outreach logs," which document recruitment efforts, and the program procedures manual.

Designing the New Hope Benefits Package

In designing the benefits package to be used for the demonstration the following objectives were used to guide decisions during the refinement process:

- make work pay by providing better remuneration (cash and benefits) at the low end of earnings and preserving incentives to increase earnings, that is, keep the implicit real marginal tax rates on earnings as low a possible.
- Avoid rewarding unstable earnings patterns;
- protect children in low-earnings households from inadequate resources;
- make payments as neutral as possible with respect to incentives to create or break up families or households;
- target payments to "worst off" families;
- reduce barriers to work arising from access to child care and health insurance but require some participant contribution (usually referred to as "copays") to obtain these benefits; and
- keep costs of total benefits package within politically feasible bounds.

Rather than launching into a detailed discussion of these objectives we will try to illustrate how they impinged on the design as we review the elements of the package of benefits that resulted from the refinement process.

I. Complications in Design

It is clear that it would be very difficult to design a package that met fully all of these seven objectives; trade-offs were necessary and further compromises had to be made if the package was not to become unduly complicated.

Further complications arose because New Hope is a demonstration and not a legislated program. Existing federal, state, and local tax and expenditure programs had features that could not be eliminated by the demonstration; the benefits package had to be designed around them, trying to integrate them where they were helpful to the program goals and to "override" them where they conflicted.

The major positive feature of existing tax and expenditure policies that could be built on was the federal Earned Income Credit (EIC). The EIC started in the 1970s at very low levels (basically to offset then-current increases in employee social security taxes) but increased slowly over the years. Just as the New Hope Project began the Congress passed the Omnibus Budget Reconciliation Act (OBRA 1993) providing for a substantial increase in the levels and coverage of the EIC. Still, the EIC alone would not be sufficient to lift any individual or family earning the minimum wage above poverty. It was natural, therefore, for the designers of New Hope to take this

program as the starting point for their effort to design a system but to attempt to improve on the EIC to assure poverty alleviation; to try to assure low-income people that "work pays," particularly compared with what they could obtain through the then existing welfare programs. In addition to the federal EIC there is a Wisconsin state EIC.

The design of the New Hope benefit package fully integrates these two programs with the New Hope benefits. In calculating supplements to individuals and families it is assumed that they will claim and receive the federal and state EIC for which they are eligible, and those amounts are netted out before the New Hope payments are made. While this is in general a substantial benefit to the participants and the demonstration in terms of the resources provided, there have been some problems generated by how the EIC benefits are perceived and claimed.¹

The major negative feature of federal and state programs that presented challenges to the designers of the New Hope package was the income-conditioning of taxes and some expenditure programs; basically, these features generate a cascading of marginal tax rates (MTRs) on income. It may be helpful here to briefly explain what we mean by the MTRs used in the context of programs like New Hope.

With respect to income taxes the MTR is calculated by considering how after-tax income changes when there is an increase in before-tax income; for example, if before-tax earnings increase by \$1,000 and after tax income increases by only \$750, then \$250 has gone to taxes and the MTR is 25 percent (\$250/\$1,000). In the context of any programs where benefits received are related to income an equivalent "implicit MTR" can be calculated. For example, suppose that when a given individual's earnings are \$9,000 per year the program benefit is \$2,025 and when the individual's earnings increase to \$10,000 the program benefit is \$1,825. The reduction in benefits is \$200, which can be thought of as a 20 percent (\$200/\$1,000) marginal tax on earnings.

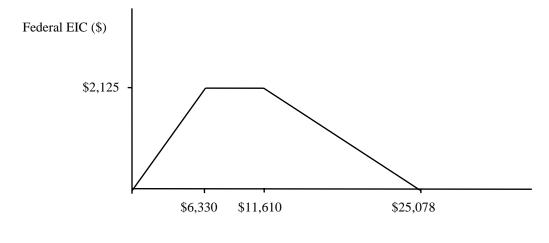

We can also talk in terms of before-tax-and-benefit income and after-tax and-benefit income and calculate total real MTRs on the basis of these concepts. Suppose that in the example above the individual earning \$9,000 paid taxes (federal and state) totaling \$1,179; her before-tax-and-benefit income would be \$9,000 and her after-tax-and-benefit income would be \$9,846 (= \$9,000 + \$2,025 - \$1,179). When her earnings rise to \$10,000, her taxes rise to \$1,460, her cash benefit falls as indicated, and then her before-tax-and-benefit income would be \$10,000 and her after-tax-and-benefit income would be \$10,365 (= \$10,000 + \$1,825 - \$1,460). The change in her before-tax-and-benefit income is \$1,000 and the change in her after-tax-and-benefit income is \$519 (\$10,365 - \$9,846). Taxes and benefit reductions have taken \$481, so her real MTR is 48.1 percent (= \$481/\$1,000).

A picture of the federal EIC may facilitate the discussion of how the New Hope benefits build on it. Figure C.1 shows how the federal EIC benefits for an earner with one child were related

¹The problems are related to claims for EIC benefits under the Advanced Earned Income Credit provisions which allow payment of EIC benefits on a prorated monthly basis "in advance," with a year-end reconciliation. Some New Hope participants were reluctant to claim Advanced EIC in fear of having to pay something back to the government at the year end reconciliation. It has been shown that it is nearly impossible for a New Hope participant to incur such an "overpayment" of the EIC. See Feldman, 1995.

Figure C.1
The New Hope Project

Federal Earned Income Tax Credit (EIC) for a Family With One Child

Earnings (\$)

to earnings per year in 1996. The EIC benefits increase over the range of earnings from zero to 6,330 to reach the maximum benefit (2,125); this is referred to as the phase-in range of earnings. The range of earnings (6,330 - 1,610) over which the EIC benefit remains constant; this is referred to as the plateau. And the range of earnings over which the benefit declines is referred to as the phase-out range of earnings. The point where benefits become zero has sometimes been referred to as the break-even level of earnings.

In Wisconsin, a state EIC program mirrors the federal EIC structure.² Note that when earnings are in the phase-out range the declining federal and state EICs are generating a real MTR on increased earnings. In addition, there are, of course, the standard taxes for the employee contribution to Social Security and unemployment insurance and federal and state income taxes. Each of these can add to the total real MTR on income and in different ways over different ranges of income.

In order to meet the objectives of targeting payments to the worst-off individuals and families, keeping payments within the politically feasible range, and having participants contribute to the costs of child care and health insurance, it was necessary, as will be more fully explained below, to reduce the amount of the cash supplements and to increase the copays as income increased. This income conditioning of New Hope benefits could create yet more complex total real MTRs.

The challenge was to try to develop a design that would deal with all these interactions among the federal and state tax and expenditure policies³ and the characteristics of the New Hope benefits in such a way as best to meet the multiple objectives outlined above.

It is useful to remember that were a program similar to New Hope in structure to be legislated at either the federal or state level it would be possible to more directly integrate the various support programs (though the historical record on conscious program integration is not encouraging in this regard).

II. The Single-Earner Package

We now turn to a detailed discussion of the various components of the New Hope benefit package. We first discuss benefits in the context of a single worker within the family, as major features can be more simply presented in this context. Then we turn to the context in which there is more than one worker in the family unit, as multiple-earner households pose some special problems.

Wage Supplement: The wage supplement is the major unique feature of the New Hope benefits. While, as noted above, the New Hope wage supplement builds on and integrates the federal and state EIC, the refined benefit structure deviates from the EICs in important ways.

²For an earner with one child the Wisconsin EIC equals 4 percent of the federal EIC at each earnings level and for earners with two children or more it equals 43 percent of the federal EIC.

³The decision was made not to try to explicitly take into account marginal tax rates generated by participants' use of Food Stamps or assisted housing programs.

First, the EICs provide little or no supplementation for single earners without children.⁴ In a sense, by making the receipt and size of EIC payments dependent on both earnings *and* the presence of children the EIC mixes two functions: supplementation of earnings and income support for children.⁵ The most radical decision made by the designers of New Hope was to try to *separate these two functions*, at least conceptually, by designing separate components, a wage supplement and a child allowance, and having the level of these benefits operate somewhat separately. Thus, in designing the wage supplement the focus was on four of the objectives listed above: making work pay, family breakup, political feasibility, and unstable earnings. The separate child allowance would focus on protecting children, targeting payments to worst-off families and political feasibility.

- In mimicking to a degree the features of the EIC⁶ basically four parameters of the wage supplement were to be set:
- the amount of the maximum supplement,
- the level of earnings at which the maximum would occur,
- the rate at which the supplement would increase as earnings increased (the phase-in rate up to a maximum point, and
- the rate at which the supplement would decrease (the phase-out rate) as earnings increased beyond the maximum point.

The level of earnings selected for the maximum supplement was the level approximated by full-time, full-year (40-hour weeks all year) earnings at the then-current minimum wage, which yielded about \$8,500. The amount of the maximum supplement was set at 25 percent of the earnings level at that point, or \$2,125.8

The choice of the level of earnings at which the benefit would reach a maximum and the choice of the level of maximum benefit implicitly indicated the rate of phase-in, namely 25 percent. Thus, the worker supplement increases by \$0.25 for each \$1 of earnings.

Given the amount of maximum benefit and the level of earnings at which the phase-out begins, the phase-out rate determines the level of earnings at which the wage supplement ends. In setting the rate one considers two objectives: making work pay and political feasibility; that is, how does this phase-out rate affect MTRs, and, therefore, incentives to strive to increase earnings, and how high up in the earnings distribution is it politically feasible to have supplementation of

⁴The 1993 OBRA legislation introduced for the first time a very small EIC for earners without children. The Wisconsin State EIC has no such benefit.

⁵The debate over extension of the federal EIC showed the tension between these two functions as advocates argued over the purposes that changes in the EIC should serve. For a brief discussion of these various functions see E. Steurele, 1995 p. 1669.

⁶One feature of the federal EIC is a range of earnings during which the benefit is held constant, sometimes referred to "the plateau." The decision was made that there was no good rational for such a "plateau" and that maintaining it in the New Hope benefit structure created problems in the phasing-out range.

⁷This was approximately the midpoint of the plateau range of earnings where the federal and state EICs are at their maximums.

⁸Various rationales for this amount of supplementation were touched upon but we will not discuss them here.

earnings extend? The decision, balancing these two considerations, was made to have the worker supplement completely phased out by \$20,000 of earnings. This yielded a phase-out rate of 20 percent, that is for each additional \$1 of earnings the wage supplement is reduced by \$0.20. (See Table C.1.)

It is important to note that this wage supplement is designed independently of the household (or family) structure and household (or family) income, which relates it to the family breakup objective, that is, incentives that the program provides for families to break up in order to maximize benefits or minimize costs. It has long been felt that the Aid to Dependent Children (AFDC) program provided strong incentives for families to break up and form a single-parent unit to qualify for benefits (though there is very limited empirical evidence of such an effect). In the tax literature these types of incentives are sometimes referred to as "the marriage penalty." The relevance here is that the amount of the wage supplement does not depend on what other earners may be in the family so there is no incentive provided to either breakup the family or to increase the family in order to gain higher benefits. We come back to this issue after discussing the child allowance below.

We have discussed here the design of the wage supplement, but, as noted above, in operation it is calculated in tandem with the estimated federal and state EIC for which the worker is eligible, and the New Hope supplement is the net above that amount which the supplement formula calls for.

Child Allowance. Given the earnings supplement structure, attention was turned to the structure of the child allowance. Again, four parameters determine the child allowance:

- the maximum benefit,
- variation in the maximum benefit with the number of children,
- the phase-in rate, and
- the phase-out rate.

Initially, how the maximum benefit should increase with the number of children was to be based on the features of the federal poverty lines - the poverty line increases in steps as the number of children increase. The governing board of New Hope felt, however, that this type of structure of the child allowance yielded total income that was too small for small-size families and too large for large-size families. In addition, since child care and health insurance would be subsidized — something not taken into account in the federal poverty line family size adjustments — some deviation from the poverty line child increments could be justified. The amounts of maximum child allowance were set at \$1,600 (per annum) for the first child, an increment of \$1,500 for the second, \$1,400 for the third, and \$1,300 for the fourth. There are no further increments for larger numbers of children.

⁹There can also be incentives for families to add members, e.g., to claim an unrelated or weakly related child as a dependent in order to qualify for higher benefits provided to larger families.

Table C.1

SOURCE: The New Hope Project.

In the pilot project, the phase-in of benefits had followed the EIC, which, as noted above, bundled the wage supplement and child allowance in a single package. In making the refinements for the actual demonstration, it was decided that there should be no phase-in of the child allowance; that it should start at the maximum amount and the lowest level of income and stay there until family income reached the phase-out point (for single-earner families \$8,500). The rationale for having no phase-in was based on two objectives: protecting children and targeting payments to worst off families. A phase-in would increase resources as families' income increased (all be it the better-off would still be below-poverty households), thus not targeting the worst-off. No phase-in gives the maximum protection to the children in families with the lowest incomes.

For the phase-out, the fundamental proposition is to have the level of the child allowance related to total family earnings. Added to this were concerns about the effects of the phase-out on the total real MTRs on earnings — the making work pay and political feasibility objectives.

In practice, the political feasibility objective and the MTS considerations interact. Political feasibility was taken to impinge on the determination of the highest level of total family income at which benefits could still be paid, sometimes referred to as "break-even income." Once the break-even income level is set and the maximum children's allowance for a given family size has been determined, the phase-out rates must be adjusted so the total amount of the children's allowance will have been phased out by the time the break-even level of income is attained; the lower the break-even level of income, the higher must be the phase-out rates.

With respect to political feasibility, after considerable deliberation with interested parties, it was decided to set complete phase-out of the child allowance — the break-even income level — at \$30,000 of total family earnings, or 200 percent of the poverty line for that family, whichever was higher. 12

To set the phase-out rate for the child allowance one could have either a constant (linear) phase-out rate or a phase-out rate that varied across income levels. The MTR criterion required considering the combined impact of the phase-out rate for the wage supplement, the phase-out rate for the child allowance, and the MTRs rates due to federal and state taxes. It was decided that since the child allowance was to be related to total family earnings, the major concern should be to integrate its phase-out rate with federal and state income tax rates. Since there is a substantial range of low income in which federal and state income taxes are zero, it was decided that in that range the phase-out rate for the child allowance could be higher. Then, when the income taxes begin, the phase-out rate for the child allowance is lowered so as to keep the combined MTRs down. After

¹⁰Ideally, it would be related to total family income but it was felt that for this demonstration, and the income level of families in the demonstration, sources of income other than earnings would be negligible.

¹¹We use the "break-even level of income" terminology here because it is common in the literature. However, even below the break-even level individuals are receiving benefits but also paying taxes, and it might be better to apply the term "break-even" at the point where benefits received exactly equals taxes paid. A better term to be applied to the point where a given program's benefits are completely phased out might be the "zero-benefit level of income".

¹²Recalling again that child allowances are adjusted up to only four children, families with more than four children would face the four-children benefit schedule and have complete phase-out at an income level equivalent to 200 percent of the poverty line for a family with four children.

considerable experimentation on paper with alternative structures it was decided that the MTR objective should be to keep the combined MTRs to 70 percent or below.¹³

Although efforts were made not only to keep total MTRs under 70 percent but also to make the MTS pattern across income ranges as smooth as possible, the complications of interaction between the program and taxes and differential child allowances by family size cause the total MTPs implied to vary both across household types and over different earnings ranges for a given household type. This is shown in Figure C.2.

The total real MTRs are negative in the range up to \$8,500 earnings because this is the range in which the wage supplement phases in; they jump to over 50 percent as the phase-out of both the wage supplement and child allowance begins and federal and state taxes increase and. stay at a very high level until about \$27,500 of earnings. Note that the MTRs are much higher for families with more children. This is because the much larger child allowance that they receive must be phased out before reaching the 200 percent poverty limit set for benefits. It is recognized that these high MTRs may discourage efforts by New Hope participants to improve their earnings but they are an unavoidable consequence of substantial benefits at lower earnings, levels that must be phased out by the point the politically feasible break-even income level is reached combined with the effects of the federal and state tax systems.

Combined Wage Supplement and Child Allowance. We have described separately two elements of the New Hope benefits package: the wage supplement and the child allowance. It is useful, however, to note briefly a few of their combined effects. In Figure C.2 and the paragraph above we described their combined effects on total real MTRs.

It was stated at the outset that New Hope benefits were designed to be sufficient to raise family income above the poverty line when the earner works at least 40 hours a week at the minimum wage. A worker earning the minimum wage working 40 hours a week all year would earn \$8500 (at the 1993 minimum wage level when the benefits were designed). At that point of earnings, the value of the New Hope wage supplement and child allowance are both at their maximum, and the gross (before tax) income of New Hope beneficiaries is above the poverty line for every family size.

In addition, we note that at this earnings level, the combined New Hope wage supplement and child allowance exceeds the value of the federal EIC and the combined value of the federal and Wisconsin State EIC for every family size.

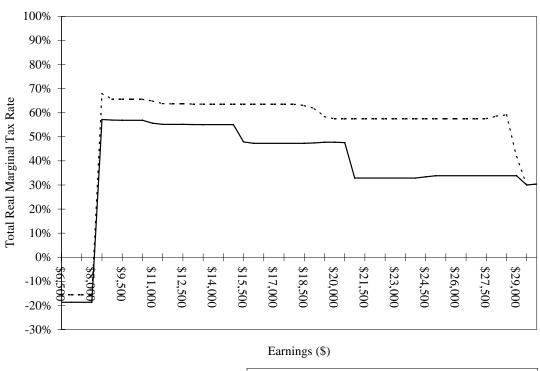

Health Benefits. Inadequate health insurance coverage has been a national concern for several years; at the same time, employer-provided health insurance has declined considerably. It

¹³One further complication in setting phase-out rates arises from the fact that the more children in the household, the higher the maximum children's allowance. For example, the maximum child allowance with one child is \$1,600 per year whereas it is \$5,800 per year for four children. In order to completely phase out higher maximum amounts with more children by the "zero-benefit income level" it is necessary to have higher phase out rates than are required for households with fewer children. Thus, for example, the initial phase-out rate (before federal income taxes start) for the child allowance with one child is 27 percent whereas with four children it is 35 percent.

Figure C.2

The New Hope Project

Total Real Marginal Tax Rates (MTRs) for Two Family Sizes

Total real MTRs for 1 earner with 1 child
Total real MTRs for 1 earner with 4 children

has been argued that fear of not obtaining health insurance and losing Medicaid coverage has increased the reluctance of welfare recipients to increase their work effort. The designers of New Hope insisted from the outset that assuring access to health insurance at a reasonable cost should be an integral part of the demonstration benefit package.

While assuring access to health insurance was a primary goal, the designers of New Hope felt it was important to have participants feel some personal responsibility for the costs of insurance, therefore they required some premium copays on the part of participants receiving health care benefits through New Hope.

In designing the health insurance benefit and copays, the designers were once again balancing objectives — in this case, making work pay, targeting payments to worst-off families, and reducing barriers to work but with shared responsibility for costs).

In setting the basic copays the designers looked at information regarding annual average employee contributions to HMO premiums in the Milwaukee area.¹⁴ Here is a summary of these contributions:

Contribution	<u>Individual</u>	Two-Person Family	<u>Three-Person (or more) Family</u>
Low average	\$72	\$112	\$168
High average	\$600	\$685	\$1,548

Note that this information indicates that among employees in Milwaukee no employee pays the full cost of the HMO premiums.

The New Hope copays were set to start at the low average, for example, \$72 for single individuals, \$168 for household with three persons or more, and then to increase slowly as income increases until they reached the high average, for example, \$600 for the single individual and \$1,548 for the household with three persons or more.

In line with the objective of targeting payments to worst off families", in the range of earnings up to \$8,000 the copay amounts are set at the low average and held constant (just like the child allowance amounts). After \$8,000 of earnings the copays increase as earnings increase.

The concerns about marginal tax rates again enter in. The rate of increase in the copays was adjusted to be low in the range of income where MTRs due to the effect of the wage supplement, child allowance, and taxes were high and then increase more sharply as necessary to attain the high

¹⁴They used the 1993 Annual Milwaukee Area Employer Healthcare Coverage Survey conducted by the Greater Milwaukee Business Groups on Health.

average copay when total family earnings are \$30,000, or 200 percent of the poverty line for that household type, which ever is higher.¹⁵

If participants become unemployed, their health coverage can continue for up to three weeks. After that they must again meet the 30-hour-per-week work requirement in order to reestablish enrollment in the health care plan. This provision was included to prevent interruption of coverage as a result of short spells of unemployment.

Child Care Benefits. Inability to obtain child care, either because of access or affordability, has long been regarded as a major barrier to low-income families with children attaining the maximum potential income from work. The designers of New Hope recognized that if work was to be the centerpiece of the demonstration, steps had to be taken to reduce such child care barriers. As with health insurance, the New Hope designers felt that shared responsibility by the participants for the costs of child care was important. Thus, the benefit is organized as a partnership in which the participant arranges care and pays for a portion of the cost and the New Hope Project ensures that the provider is licensed by Milwaukee County and is paid in a timely manner. Assistance for child care is available for children under age 13 at either a child care center or at an individual provider. To be eligible for such benefits a participant who is single must work at least 30 hours per week and the spouse of a married participant must work at least 15 hours per week.

The participant cost share, or copay, is related to the number of children in child care and is calculated as a percentage of the children's allowance amount for that number of children. The base, or minimum, child care copay is as follows:

Number of Children in Child Care	Minimum Child Care CoPay
1	\$400 (25% of \$1,600)
2	\$775 (25% of \$3,100)
3	\$1,125 (25% of \$4,500)
4 or more	\$1,450 (25% of \$5,800)

These minimum copays are held constant as earnings increase up to total family earnings of \$8,500 and after that they rise by 1 percent of any increase in earnings; for example, if earnings increase from \$9,000 to \$10,000 the child care copay increases by \$10. This low rate of increase of the copay was dictated by the concern to keep real MTRs or below 70 percent. When the total family earnings exceed 200 percent of the poverty line or \$30,000 (which ever is higher) the New Hope subsidy ends and the participant must pay full costs of any child care.

As with the health care coverage, if the worker becomes unemployed the participant is eligible for part-time child care subsidy from New Hope. The program will pay for a certain number of hours of child care each day for three weeks, or 20 percent of child care costs during three periods of unemployment.

¹⁵For the single individual copays are increased so the high average copay (\$600) is obtained at \$20,000 in earnings.

III. The Multiple-Earner Package

The basic parameters of the New Hope benefit package are as we have described them above for the single earner case. Some complications arise, however, when there is more than one earner in a household.

With multiple earners in the household, the principle of a wage supplement determined solely by each worker's earnings comes strongly into play. The amount of supplement attributed to each worker is calculated on the basis of that earner's pay without regard to what others in the family are earning. The argument for this principle is twofold: first, in the American workplace, almost without exception, the rate of workers pay is unrelated to their family circumstances, either the size of their family or the level of income or wealth of the family. At a given job, in a given establishment, all workers are rewarded for their efforts at the same rate. Second, the more the benefits are determined independent of other family members economic status, the less are incentives introduced to either break up family units or form family units in order to maximize benefits or to minimize costs (taxes) — family breakup objective. It can be argued that, like the minimum wage, this principle works against the targeting payments to worst off families objective), it is "target inefficient" because a low-earning worker in a high-income family qualifies for the same wage supplement as another worker at the same low-earnings level who is in a low-income family. However, since highlighting the incentives to work and to increase earnings is a central objective, it was decided that in this case this principle should override the objective.

Applying this principle of independent worker wage supplements can generate various complicated patterns of implicit MTRs at the household level; one earner might be in the phase-out range of earnings, for example, increasing earnings from \$11,500 to \$12,000, and have a benefit *reduction* rate of 20 percent while the other earner is in the phase-in range of earnings, for example, increasing earnings from \$6,000 to \$7,000, and has a benefit *increase* rate of 25 percent. In another family with the same initial total family earnings, for example, \$17,500, one earner might be at the \$9,000 earnings level and the second at the \$8,500 level and both would face a benefit reduction rate of 20 percent.

The designers of the New Hope benefits package ameliorated these problems first by relating the child allowance phase-out rates to number of children, total family earnings, and the federal income tax rates and by keeping a close eye on the overall possible real MTRs (change in after-benefit-after-tax-after-copay income divided by change in before-benefit-before-tax-before-copay total family earnings) while designing the child care and health insurance co-pays.

However, another problem remained. The political feasibility objective implied that there should be some level of total family earnings at which all New Hope benefits had been terminated. As discussed above, this break-even income level was set at \$30,000 or 200 percent of poverty, whichever was higher for the given family type. Given this, and the principle of worker's wage supplement determined solely by that worker's earnings, the situation could arise where a second earner was still eligible for a worker's supplement when the total family earnings hit \$30,000. For example in a household with two workers with one child, if the first worker was earning \$25,000 and the second worker moved up from \$5,000 to \$6,000. then the wage supplement formula would call for the second worker, who had been receiving \$1,250. to now receive a wage supplement of \$1,500, but the break-even income level cap would dictate no supplement be paid; the MTR on the

second worker's \$1,000 increase in earnings would be 125 percent. This type of phenomenon, implicit MTRs in excess of 100 percent, has sometimes been referred to as a "cliff."

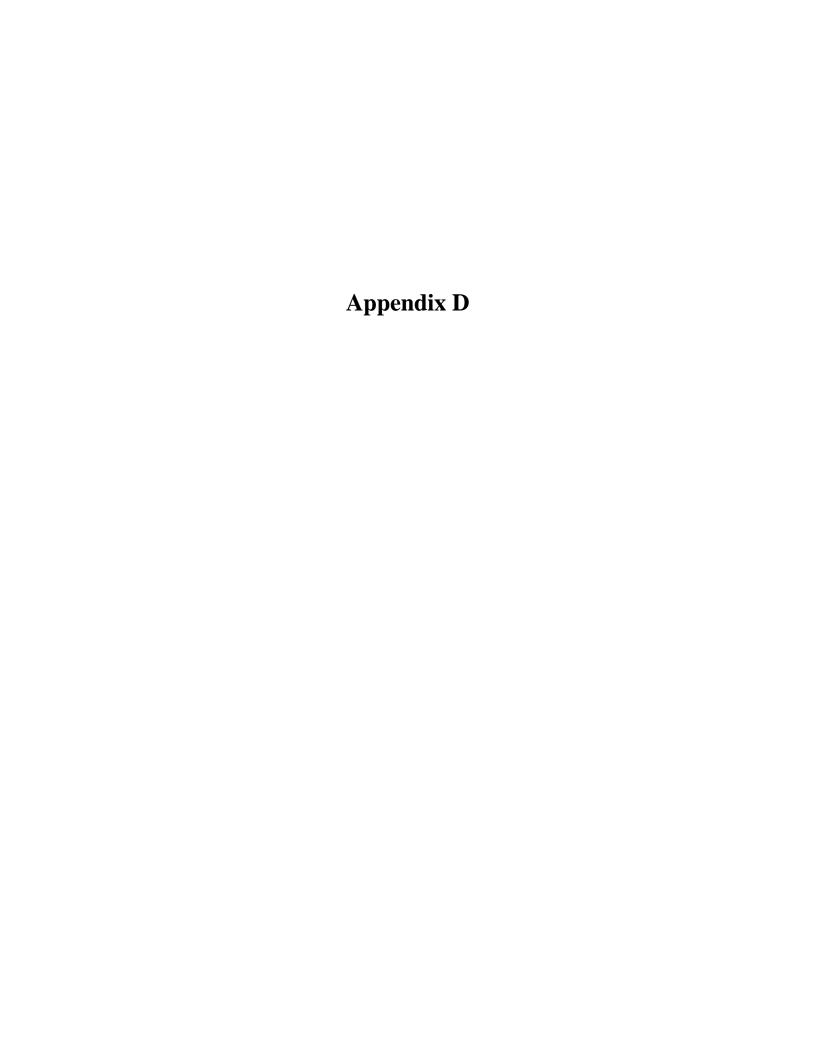

It was decided that the principle of independent worker wage supplements would be maintained even though in some cases it combined with the break-even income level cap — political feasibility objective — to generate "cliffs," that is, MTRs in excess of 100 percent right at the break-even income level. It was judged unlikely that many families in the New Hope demonstration would in fact reach this level of total family earnings. It was hoped that if they did so the family would have become so committed to high work effort and improvement in earnings that it would ignore the "cliff" effect at that level.

In the case of the two-earner family the role of the separation of the wage supplement and the child allowance in reducing the "marriage penalty" — family breakup objective — becomes more evident. The greater the portion of the total of the package of benefits is in the wage supplement, the less is the incentive to form separate family units. It is only the effect of the second earner's earnings on reducing the child allowance portion that constitutes an incentive to break up. ¹⁶

Another issue that arises in the two-earner case is what the minimum hours of work should be in order for the second worker to qualify for a wage supplement. Recall that for the single worker there is a minimum of 30 hours of work before the worker and family qualify for any benefits. Further note that consistent with the emphasis on making work pay but also providing a child allowance, there is no addition to benefits if there is a second adult in the family who is not working; in this case the New Hope benefits are the one worker's wage supplement, the child allowance and health insurance subsidy. It was decided that the second adult must work at least 15 hours a week in order to qualify for a wage supplement and that it would be related to the level of that worker's earnings. In addition, the family would not qualify for the child care subsidy unless the second adult were working at least 15 hours a week.¹⁷

¹⁶For example, suppose a family with two children has one worker earning \$9,000 and the second \$6,500. If the second worker had an opportunity to increase earnings to \$7,000 his wage supplement would go up by \$125 (as he is in the phase-in range). Since total family earnings rise from \$15,500 to \$16,000 the child allowance they are entitled to falls from \$963 to \$813. The increase in the wage supplement offsets to a large degree the decline in the child allowance.

¹⁷A further adjustment in the child care subsidy formula is made where there are two earners. The copayment requirement is held constant until total family earnings reach \$15,000 and then increases slowly as family total earnings increase. Recall that in the single earner case the copayment remained constant until \$8,000 of earnings and then began to increase. The rationale was that if the first earner is working 40 hours a week at the minimum wage, obtaining about \$8,500 per annum, and the second worker works 30 hours a week at the minimum wage, obtaining about \$6,500 per annum, the total family earnings are \$15,000. Thus, holding the co-pay constant helps to encourage the second worker to increase work up to 30 hours.

Methodology of the New Hope Neighborhood Survey

Using the initial dwelling-based sample to make inferences about individuals or about the entire population of the target areas requires adjustment for differential sampling probability, an apparent gender bias in response rates, the New Hope Neighborhood Survey (NHNS) method of enumeration of children, and nonresponse. Each is discussed in turn.

Differential Sampling Probability. While the probability of selection for the sample was equal across all dwelling units, the probability of selection for adults was not, because the number of adults varies across households. Once a dwelling unit is selected for the sample, an adult in a household with three others aged 18 or over has only one-quarter the chance that a single adult living alone has of being interviewed. As a result, without adjustment, inferences about the situation of all adults in these neighborhoods drawn from the sample of respondents would be biased toward characteristics of adults living alone.

Table D.1 presents a first tabulation of raw NHNS data. The respondents are counted on the basis of relationship to other household members and according to the total number of adults reported to be living in the household. Only about one-third (246 of 719) of the NHNS respondents were adults living alone, so the "most recent birthday" rule was applied in almost two of every three interviews. Almost one NHNS respondent of five lives in a household comprising at least three adults. Correction for this differential probability of interviewing is relatively straightforward: in all instances of inference concerning the characteristics of all New Hope neighborhood residents in the material that follows, responses are weighted by number of adults in the household — the larger the respondent's household, the greater the weight.

Gender Bias. Weighting for the number of adults is not the only adjustment that must be made. The NHNS results exhibit a gender bias that is common to household survey data. The sample includes more women (60 percent) than men (40 percent). This could reflect a gender differential in the neighborhood population; in the 1990 census men constituted only 47 percent of the adult population in these neighborhoods. However, evidence that the gender differential produced by the survey may reflect something other than actual neighborhood population is provided by tabulation of gender of the 326 respondents who report being married or living with a partner. These data are reported in Table D.2. For couples, the procedure followed to select respondents should produce equal numbers of women and men, since there is no reason to believe that on any particular date women are more likely to have been born recently than men. However, for married couples only 45 percent of respondents were male, and only 42 percent of respondents reporting living with a partner were male. The differential is roughly the same for elderly respondents as for those who were under age 65. The odds that the overall 44-56 percent

¹See O'Rourke and Lakner, 1989, for another example of the problem.

split would have appeared in a sample this large had the true probability of selection been .5 are less than 1 chance in $40.^2$

This difference in response rates between men and women may reflect both gender differences in willingness to participate in interviews and a possible tendency for women, who are more likely to be the first person contacted by interviewers, to deny survey interviewers access to men in the household. In the absence of additional information, the analysis assumes that the gender response bias evident in Table D.2 applies to all adults who do not reside alone, that is, that women are approximately 25 percent more likely to be respondents than men. The tabulations of personal and family characteristics that follow are reweighted to correct for this differential as well as the sampling bias created by variation in household size already discussed.

Enumeration of Children. The structure of questions in the NHNS in part reflected standards of eligibility for New Hope itself. This characteristic is reflected in the questioning of respondents concerning the numbers of adults and children present. The question posed concerning adults was straightforward: "Besides yourself, how many adults 18 years of age or older live in this household?" This is one of the bases for Table D.1. The question posed concerning the number of children was different. Instead of asking for the number of children present, NHNS interviewers asked for the number of children of the respondent and/or his or her spouse/partner who were present. Number of children reported this way is what counts in determining eligibility for some New Hope services. However, the method of posing the question creates a problem for estimating the total number of children in the respondent's household, because if the informant selected by the birthday rule turned out not to be a child's parent, guardian, or spouse or partner of his or her parent or guardian, the child would not be reported. In calculations reported in Chapter 4 for total population for New Hope target neighborhoods, responses for respondents with children who are living in households that include adults other than their spouse or partner are reweighted to reflect the fact that some such interviews failed to count children present.³

Nonresponse. Finally, where inferences are required for total population, adjustment for nonresponse is made by assuming that households for which interviews could not be obtained are identical to those for which interviews were obtained in the same target area. The Southside response rate was 84.75 percent, so population counts derived from responses are inflated by 1/.8475 = 1.18 to obtain a count for the entire sample. On the Northside, where responses rates were lower, this response inflation factor is 1.25.

It would be useful to refine this procedure on the basis of other characteristics of the addresses at which interviews were not obtained, but available data offer little immediate prospect of significant estimate improvement from more elaborate approaches. The adjustments

²It is likely that some of the unmarried partnerships reported in the NHNS are same-sex. If these relationships are predominantly female, then such arrangements could account for the greater gender imbalance among unmarried than married couples. It was not possible to identify such relationships from the survey responses.

³The adjustment applied in estimating total population is to multiply the number of children reported by each respondent by T/C, where T is the number of adults in the household and C=1 if the respondent has no spouse or partner, C=2 otherwise.

Table D.2

applied are likely to exaggerate population and, in particular, the number of children, if refusals and other problems are concentrated among households that include only adults.

The earlier discussion of possible gender bias in responses obtained from persons who reported living with a spouse or partner emphasizes that in principle the procedure followed in the NHNS to identify respondents gave members of both marital and other partnerships equal chance to be selected. The NHNS includes questions covering partner's status. If each respondent uses the same standards to evaluate his or her partner's status as is applied personally, the result should be that the situation of respondents and partners looks the same.

Table D.3 summarizes responses regarding own and partner's unemployment for respondents under age 65 who live with a spouse or partner. Respondents tend to be marginally more likely to report themselves as having looked for work if they are jobless than they do for their partners, and they are marginally more likely to declare partners "retired" if they are not looking for full-time work than they are to so designate themselves. The standard error of the estimated difference in unemployment rates between respondents and partners is about 2.9 percentage points. The 4 percentage point difference reported in the table is not, therefore, statistically significant by common standards.

2 or more	33.0	37.3	35.2	
Missing	5.0	4.1	4.6	
Sample size	678	679	1,357	

SOURCE: MDRC calculations from Background Information Forms for 1,357 sample members randomly assigned from August 1994 through December 1995. Five additional sample members who were missing these forms were excluded from the sample.

NOTES: Except for three items, the nonresponse rate for all specific characteristics was less than 1 percent and therefore these missings were excluded from the calculations. For the three characteristics, for which the nonresponse rate ranged from 5 to 7 percent for the full sample, the nonresponses are shown on the table as missings.

Distributions may not add to 100.0 percent because of rounding.

^aA chi-square test or a t-test was used to assess the statistical significance of each difference in characteristics between the program group and the control group. Statistical significance levels are indicated as *=1 percent, **=5 percent, and ***=1 percent.

^bBecause some sample members may be in more than one category, totals may not equal all categories summed.

^cIncludes all dependents under age 18.

^dIncludes all dependents under age 18.

^eThe percentage of households with a second potential wage earner represents the number of heads of household who at the time of random assignment provided the Social Security number of a second adult living in the household who might participate in New Hope.

^fThis refers to the total number of months accumulated from at least one spell on an individual's own AFDC or GA case or the case of another adult in the household.

^gThe GED credential is given to those who pass the GED test and is intended to signify knowledge of basic high school subjects.

Sample and Characteristic by Measure	CFS Sample	Full Sample
Client-reported situations that affect employment		
Those who reported health problems that limit the type of work they can do (%)	10.7	14.3
Those who have (%):		
Ever been evicted from an apartment or house over the last 10 years	20.0	17.5
Ever been homeless	18.2	21.5
Ever quit a job	59.4	60.0
Client-reported education and training preferences		
Those who agreed a lot that they wanted to (%):		
Go to school part time to study basic reading and math	35.3	33.1
Go to school part time to get a GED	35.1	34.4
Get on-the-job training for 1-3 months in a type of work		
that they have not tried before	58.2	59.0
Get on-the-job training so that they would know what it is like to work	54.2	51.9
Sample size	642	1,079

SOURCES: MDRC calculations from Background Information Forms for 812 sample members randomly assigned from August 1994 through December 1995. MDRC calculations from Private Opinion Survey (POS) data for sample members randomly assigned from August 1994 through December 1995. The POS questions were voluntarily answered by 642 sample members (80 percent) just prior to random assignment.

NOTES: Except for two items, the nonresponse rate for all specific characteristics was less than 1 percent and therefore these missings were excluded from the calculations. For the two characteristics, for which the nonresponse rate ranged from 5 to 7 percent for the full sample, the nonresponses are shown on the table as missings.

Distributions may not add to 100.0 percent because of rounding.

Dashes indicate that the sample size is under 10; therefore the calculations were omitted.

^aThe sample includes all New Hope sample members whose households included at least one child in the age range of 1 to 10 years (12 to 131 months) at the time of random assignment.

^fThis refers to the total number of months accumulated from at least one spell on an individual's own AFDC or GA case or the case of another adult in the household.

^gThe GED credential is given to those who pass the GED test and is intended to signify knowledge of basic high school subjects.

^bBecause some sample members may be in more than one category, totals may not equal all categories summed.

^cIncludes all dependents under age 18.

^dIncludes all dependents under age 18.

^eSome CFS households have children in both categories.

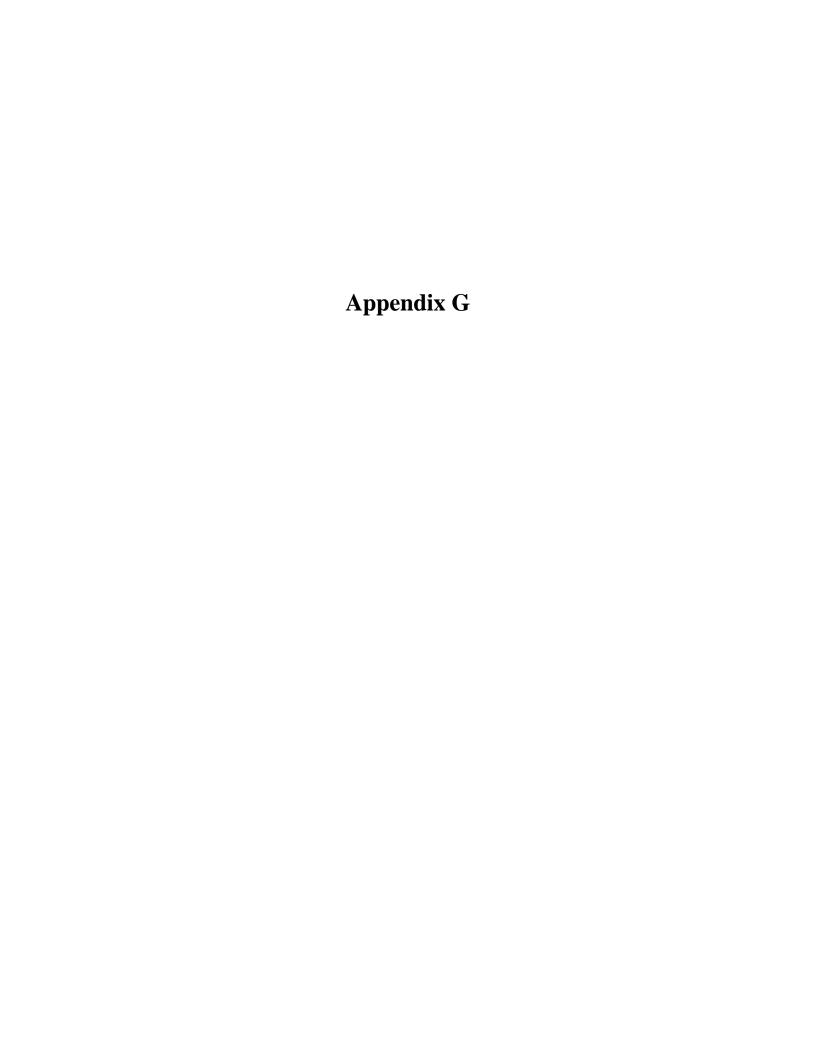

Table G.1

SOURCE: The New Hope Project.

NOTES: All figures are based on 1996 Earned Income Credit (EIC) benefits and poverty guidelines. Total New Hope financial support is made up of two parts: (1), the New Hope supplement, which is based on earnings (one worker or two) and (2), the child allowance, which is based on earnings and number of dependent children under age 13. These financial benefits are set to boost a person's gross income (earnings + New Hope supplement + government EIC) above poverty level at full-time work at the minimum wage (\$708).

^aPhase-in refers to the rate at which the total worker supplement would increase as worker's earnings increased up to the maximum point for the total worker supplement. Annual maximum refers to the maximum dollar amount of the total worker supplement that a worker could receive. Phase-out refers to the rate at which the total worker supplement would decrease as worker's earnings increased beyond the maximum point.

^bRepresents the amount that New Hope would supplement earnings before netting out federal and state earned income credits.

^cHas been adjusted for the effects of inflation; as a result, the New Hope supplement and the government EIC do not add precisely to the Worker 1 supplement.

^dMay include the federal and state EIC. Individuals with or without children are eligible for the federal EIC, with the exception of one-earner households where the individual is under age 25 and has no children. The state EIC is available only for individuals who have children.

^eIncludes federal and state income taxes and FICA. In addition, taxes may vary depending on income filing status.

Table G.7 (continued)

SOURCE and NOTES: See Table G.1.

Two-earner tables are for illustration only because precise New Hope support depends on each person's earnings. In addition, in households with two earners the second earner must work at least part time at the minimum wage.

Selected Publications on MDRC Projects

Reforming Welfare

Books and Monographs

- *Reforming Welfare with Work* (Ford Foundation). Monograph. 1987. Judith M. Gueron. A review of welfare-to-work initiatives in five states.
- From Welfare to Work (Russell Sage Foundation). Book. 1991. Judith M. Gueron, Edward Pauly. A synthesis of research findings on the effectiveness of welfare-to-work programs. Chapter 1, which is the summary of the book, is also published separately by MDRC.
- Five Years After: The Long-Term Effects of Welfare-to-Work Programs (Russell Sage Foundation). Book. 1995. Daniel Friedlander, Gary Burtless. An analysis of five-year follow-up data on four welfare-to-work programs.
- After AFDC: Welfare-to-Work Choices and Challenges for States. Book. 1997. Dan Bloom. A summary and synthesis of lessons derived from studies of welfare reform programs.

ReWORKing Welfare: Technical Assistance for States and Localities

After AFDC: Welfare-to-Work Choices and Challenges for States. See under Books and Monographs.

Changing to a Work First Strategy: Lessons from Los Angeles County's GAIN Program for Welfare Recipients.

1997. Evan Weissman.

Work First: How to Implement an Employment-Focused Approach to Welfare Reform. 1997. Amy Brown.

Connections to Work Project

Alternative approaches to help welfare recipients and other low-income populations access and secure jobs.

Tulsa's IndEx Program: A Business-Led Initiative for Welfare Reform and Economic Development. 1997. Maria Buck.

Working Papers

Working Papers related to a specific project are listed under that project.

Learning from the Voices of Mothers: Single Mothers' Perceptions of the Trade-offs Between Welfare and Work. 1993. LaDonna Pavetti.

Unpaid Work Experience for Welfare Recipients: Findings and Lessons from MDRC Research. 1993. Thomas Brock, David Butler, David Long.

From Welfare to Work Among Lone Parents in Britain: Lessons for America. 1996. James Riccio.

Papers for Practitioners

Assessing JOBS Participants: Issues and Trade-offs. 1992. Patricia Auspos, Kay Sherwood.

Linking Welfare and Education: A Study of New Programs in Five States. 1992. Edward Pauly, David Long, Karin Martinson.

Improving the Productivity of JOBS Programs. 1993. Eugene Bardach.

Note: For works not published by MDRC, the publisher's name is shown in parentheses.

Reports and Other Publications

Making Work Pay

The New Hope Project

A test of a neighborhood-based antipoverty program and welfare alternative operating in Milwaukee.

The New Hope Offer: Participants in the New Hope Demonstration Discuss Work, Family, and Self-Sufficiency. Working Paper. 1996. Dudley Benoit.

Who Got New Hope? Working Paper. 1997. Michael Wiseman.

Creating New Hope: Implementation of a Program to Reduce Poverty and Reform Welfare. 1997. Thomas Brock, Fred Doolittle, Veronica Fellerath, Michael Wiseman.

The Minnesota Family Investment Program (MFIP)

An evaluation of Minnesota's welfare reform initiative.

MFIP: An Early Report on Minnesota's Approach to Welfare Reform. 1995. Virginia Knox, Amy Brown, Winston Lin.

Making Welfare Work and Work Pay: Implementation and 18-Month Impacts of the Minnesota Family Investment Program. 1997. Cynthia Miller, Virginia Knox, Patricia Auspos, Jo Anna Hunter-Manns, Alan Orenstein.

Canada's Self-Sufficiency Project (SSP)

A test of the effectiveness of a temporary earnings supplement on the employment and welfare receipt of public assistance recipients. Reports on the Self-Sufficiency Project are available from: Social Research and Demonstration Corporation (SRDC), 275 Slater St., Suite 900, Ottawa, Ontario K1P 5H9, Canada. Tel.: 613-237-4311; Fax: 613-237-5045. In the United States, the reports are also available from MDRC.

- Making Work Pay Better Than Welfare: An Early Look at the Self-Sufficiency Project (Social Research and Demonstration Corporation). 1994. Susanna Lui-Gurr, Sheila Currie Vernon, Tod Mijanovich.
- Creating an Alternative to Welfare: First-Year Findings on the Implementation, Welfare Impacts, and Costs of the Self-Sufficiency Project (Social Research and Demonstration Corporation). 1995. Tod Mijanovich, David Long.
- The Struggle for Self-Sufficiency: SSP Participants Talk About Work, Welfare, and Their Futures (Social Research and Demonstration Corporation). 1995. Wendy Bancroft, Sheila Currie Vernon.
- Do Financial Incentives Encourage Welfare Recipients to Work? Initial 18-Month Findings from the Self-Sufficiency Project (Social Research and Demonstration Corporation). 1996. David Card, Philip Robins.
- When Work Pays Better Than Welfare: A Summary of the Self-Sufficiency Project's Implementation, Focus Group, and Initial 18-Month Impact Reports. 1996. Social Research and Demonstration Corporation.
- How Important Are "Entry Effects" in Financial Incentive Programs for Welfare Recipients? Experimental Evidence from the Self-Sufficiency Project (Social Research and Demonstration Corporation). Working Paper. 1997. David Card, Philip Robins, Winston Lin.

Time-Limited Welfare

Florida's Family Transition Program

A study of Florida's initial time-limited welfare program.

- The Family Transition Program: An Early Implementation Report on Florida's Time-Limited Welfare Initiative. 1995. Dan Bloom.
- The Family Transition Program: Implementation and Early Impacts of Florida's Initial Time-Limited Welfare Program. 1997. Dan Bloom, James Kemple, Robin Rogers-Dillon.

The Cross-State Study of Time-Limited Welfare

An examination of the implementation of some of the first state-initiated time-limited welfare programs.

Implementing Time-Limited Welfare: Early Experiences in Three States. 1995. Dan Bloom, David Butler. The View from the Field: As Time Limits Approach, Welfare Recipients and Staff Talk About Their Attitudes and Expectations. 1997. Amy Brown, Dan Bloom, David Butler.

JOBS Programs

National Evaluation of Welfare-to-Work Strategies

An evaluation of welfare-to-work programs launched under the Job Opportunities and Basic Skills Training (JOBS) provisions of the Family Support Act of 1988.

From Welfare to Work (Russell Sage Foundation). See under Books and Monographs.

The Saturation Work Initiative Model in San Diego: A Five-Year Follow-up Study. 1993. Daniel Friedlander, Gayle Hamilton.

Early Lessons from Seven Sites (U.S. Department of Health and Human Services [HHS]). 1994. Gayle Hamilton, Thomas Brock.

Five Years After: The Long-Term Effects of Welfare-to-Work Programs. See under Books and Monographs. Adult Education for People on AFDC: A Synthesis of Research. (U.S. Department of Health and Human Services, Office of the Assistant Secretary for Planning and Evaluation [HHS, ASPE]). 1995. Edward Pauly.

Early Findings on Program Impacts in Three Sites (HHS, ASPE). 1995. Stephen Freedman, Daniel Friedlander.

How Well Are They Faring? AFDC Families with Preschool-Aged Children in Atlanta at the Outset of the JOBS Evaluation (HHS, ASPE). 1995. Child Trends, Inc.: Kristin Moore, Martha Zaslow, Mary Jo Coiro, Suzanne Miller, Ellen Magenheim.

Monthly Participation Rates in Three Sites and Factors Affecting Participation Levels in Welfare-to-Work Programs (HHS, ASPE). 1995. Gayle Hamilton.

Changing to a Work First Strategy: Lessons from Los Angeles County's GAIN Program for Welfare Recipients. 1997. Evan Weissman.

Work First: How to Implement an Employment-Focused Approach to Welfare Reform. 1997. Amy Brown.

Evaluating Two Welfare-to-Work Program Approaches: Two-Year Findings on the Labor Force Attachment and Human Capital Development Programs in Three Sites (HHS, Administration for Children and Families and ASPE). 1997. Gayle Hamilton, Thomas Brock, Mary Farrell, Daniel Friedlander, Kristen Harknett.

The GAIN Evaluation

An evaluation of California's Greater Avenues for Independence (GAIN) Program, the state's JOBS program.

- GAIN: Planning and Early Implementation. 1987. John Wallace, David Long.
- GAIN: Child Care in a Welfare Employment Initiative. 1989. Karin Martinson, James Riccio.
- *GAIN: Early Implementation Experiences and Lessons.* 1989. James Riccio, Barbara Goldman, Gayle Hamilton, Karin Martinson, Alan Orenstein.
- GAIN: Participation Patterns in Four Counties. 1991. Stephen Freedman, James Riccio.
- GAIN: Program Strategies, Participation Patterns, and First-Year Impacts in Six Counties. 1992. James Riccio, Daniel Friedlander.
- GAIN: Two-Year Impacts in Six Counties. 1993. Daniel Friedlander, James Riccio, Stephen Freedman.
- GAIN: Basic Education in a Welfare-to-Work Program. 1994. Karin Martinson, Daniel Friedlander.
- GAIN: Benefits, Costs, and Three-Year Impacts of a Welfare-to-Work Program. 1994. James Riccio, Daniel Friedlander, Stephen Freedman.

Related Studies:

The Impacts of California's GAIN Program on Different Ethnic Groups: Two-Year Findings on Earnings and AFDC Payments. Working Paper. 1994. Daniel Friedlander.

- Can They All Work? A Study of the Employment Potential of Welfare Recipients in a Welfare-to-Work Program. Working Paper. 1995. James Riccio, Stephen Freedman.
- Changing to a Work First Strategy: Lessons from Los Angeles County's GAIN Program for Welfare Recipients. 1997. Evan Weissman.

The Evaluation of Florida's Project Independence

An evaluation of Florida's JOBS program.

- Florida's Project Independence: Program Implementation, Participation Patterns, and First-Year Impacts. 1994. James Kemple, Joshua Haimson.
- Florida's Project Independence: Benefits, Costs, and Two-Year Impacts of Florida's JOBS Program. 1995. James Kemple, Daniel Friedlander, Veronica Fellerath.

Other Welfare Studies

The Saturation Work Initiative Model (SWIM)

A test of the feasibility and effectiveness of an ongoing participation requirement in a welfare-to-work program.

Interim Report on the Saturation Work Initiative Model in San Diego. 1988. Gayle Hamilton.

Final Report on the Saturation Work Initiative Model in San Diego. 1989. Gayle Hamilton, Daniel Friedlander.

The Saturation Work Initiative Model in San Diego: A Five-Year Follow-up Study. 1993. Daniel Friedlander, Gayle Hamilton.

The Demonstration of State Work/Welfare Initiatives

A test of the feasibility and effectiveness of various state employment initiatives for welfare recipients.

Arizona: Preliminary Management Lessons from the WIN Demonstration Program. 1984. Kay Sherwood.

Arkansas: Final Report on the WORK Program in Two Counties. 1985. Daniel Friedlander, Gregory Hoerz, Janet Quint, James Riccio.

California: Final Report on the San Diego Job Search and Work Experience Demonstration. 1986. Barbara Goldman, Daniel Friedlander, David Long.

Illinois: Final Report on Job Search and Work Experience in Cook County. 1987. Daniel Friedlander, Stephen Freedman, Gayle Hamilton, Janet Quint.

Maine: Final Report on the Training Opportunities in the Private Sector Program. 1988. Patricia Auspos, George Cave, David Long.

Maryland: Final Report on the Employment Initiatives Evaluation. 1985. Daniel Friedlander, Gregory Hoerz, David Long, Janet Quint.

Supplemental Report on the Baltimore Options Program. 1987. Daniel Friedlander.

New Jersey: Final Report on the Grant Diversion Project. 1988. Stephen Freedman, Jan Bryant, George Cave.

Virginia: Final Report on the Virginia Employment Services Program. 1986. James Riccio, George Cave, Stephen Freedman, Marilyn Price.

West Virginia: Final Report on the Community Work Experience Demonstrations. 1986. Daniel Friedlander, Marjorie Erickson, Gayle Hamilton, Virginia Knox.

Other Reports on the Demonstration of State Work/Welfare Initiatives

Relationship Between Earnings and Welfare Benefits for Working Recipients: Four Area Case Studies. 1985. Barbara Goldman, Edward Cavin, Marjorie Erickson, Gayle Hamilton, Darlene Hasselbring, Sandra Reynolds.

A Survey of Participants and Worksite Supervisors in the New York City Work Experience Program. 1986. Gregory Hoerz, Karla Hanson.

Welfare Grant Diversion: Lessons and Prospects. 1986. Michael Bangser, James Healy, Robert Ivry.

The Subgroup/Performance Indicator Study

A study of the impacts of selected welfare-to-work programs on subgroups of the AFDC caseload.

Subgroup Impacts and Performance Indicators for Selected Welfare Employment Programs. 1988. Daniel Friedlander.

The WIN Research Laboratory Project

A test of innovative service delivery approaches in four Work Incentive Program (WIN) offices.

Impacts of the Immediate Job Search Assistance Experiment: Louisville WIN Research Laboratory Project. 1981.

Barbara Goldman.

Welfare Women in a Group Job Search Program: Their Experiences in the Louisville WIN Research Laboratory Project. 1982. Joanna Gould-Stuart.

Job Search Strategies: Lessons from the Louisville WIN Laboratory. 1983. Carl Wolfhagen, Barbara Goldman.

The Self-Employment Investment Demonstration (SEID)

A test of the feasibility of operating a program to encourage self-employment among recipients of AFDC.

Self-Employment for Welfare Recipients: Implementation of the SEID Program. 1991. Cynthia Guy, Fred Doolittle, Barbara Fink.

Programs for Teenage Parents

The LEAP Evaluation

An evaluation of Ohio's Learning, Earning, and Parenting (LEAP) Program, which uses financial incentives to encourage teenage parents on welfare to stay in or return to school.

- *LEAP: Implementing a Welfare Initiative to Improve School Attendance Among Teenage Parents.* 1991. Dan Bloom, Hilary Kopp, David Long, Denise Polit.
- *LEAP: Interim Findings on a Welfare Initiative to Improve School Attendance Among Teenage Parents.* 1993. Dan Bloom, Veronica Fellerath, David Long, Robert Wood.
- LEAP: The Educational Effects of LEAP and Enhanced Services in Cleveland. 1994. David Long, Robert Wood, Hilary Kopp.
- LEAP: Three-Year Impacts of Ohio's Welfare Initiative to Improve School Attendance Among Teenage Parents. 1996. David Long, Judith Gueron, Robert Wood, Rebecca Fisher, Veronica Fellerath.
- LEAP: Final Report on Ohio's Welfare Initiative to Improve School Attendance Among Teenage Parents. 1997. Johannes Bos, Veronica Fellerath.

The New Chance Demonstration

A test of a comprehensive program of services that seeks to improve the economic status and general well-being of a group of highly disadvantaged young women and their children.

- New Chance: Implementing a Comprehensive Program for Disadvantaged Young Mothers and Their Children. 1991. Janet Quint, Barbara Fink, Sharon Rowser.
- Lives of Promise, Lives of Pain: Young Mothers After New Chance. Monograph. 1994. Janet Quint, Judith Musick, with Joyce Ladner.
- New Chance: Interim Findings on a Comprehensive Program for Disadvantaged Young Mothers and Their Children. 1994. Janet Quint, Denise Polit, Hans Bos, George Cave.
- New Chance: The Cost Analysis of a Comprehensive Program for Disadvantaged Young Mothers and Their Children. Working Paper. 1994. Barbara Fink.
- New Chance: Final Report on a Comprehensive Program for Young Mothers in Poverty and Their Children. 1997. Janet Quint, Johannes Bos, Denise Polit.

Parenting Behavior in a Sample of Young Single Mothers in Poverty: Results of the New Chance Observational Study. 1997. Martha Zaslow, Carolyn Eldred, editors.

Project Redirection

A test of a comprehensive program of services for pregnant and parenting teenagers.

The Challenge of Serving Teenage Mothers: Lessons from Project Redirection. Monograph. 1988. Denise Polit, Janet Quint, James Riccio.

The Community Service Projects

A test of a New York State teenage pregnancy prevention and services initiative.

The Community Service Projects: Final Report on a New York State Adolescent Pregnancy Prevention and Services Program. 1988. Cynthia Guy, Lawrence Bailis, David Palasits, Kay Sherwood.

The Parents' Fair Share Demonstration

A demonstration aimed at reducing child poverty by increasing the job-holding, earnings, and child support payments of unemployed, noncustodial parents (usually fathers) of children receiving public assistance.

Caring and Paying: What Fathers and Mothers Say About Child Support. 1992. Frank Furstenberg, Jr., Kay Sherwood, Mercer Sullivan.

Child Support Enforcement: A Case Study. Working Paper. 1993. Dan Bloom.

Matching Opportunities to Obligations: Lessons for Child Support Reform from the Parents' Fair Share Pilot Phase. 1994. Dan Bloom, Kay Sherwood.

Low-Income Parents and the Parents' Fair Share Demonstration: An Early Qualitative Look at Low-Income Noncustodial Parents (NCPs) and How One Policy Initiative Has Attempted to Improve Their Ability to Pay Child Support. 1996. Earl Johnson, Fred Doolittle.

The National Supported Work Demonstration

A test of a transitional work experience program for four disadvantaged groups.

Summary and Findings of the National Supported Work Demonstration. 1980. MDRC Board of Directors.

The Section 3 Study

Lessons from the Field on the Implementation of Section 3 (U.S. Department of Housing and Urban Development, Office of Policy Development and Research). 1996. Maxine Bailey, Suzanne Lynn.

About MDRC

The Manpower Demonstration Research Corporation (MDRC) is a nonprofit social policy research organization founded in 1974 and located in New York City and San Francisco. Its mission is to design and rigorously field-test promising education and employment-related programs aimed at improving the well-being of disadvantaged adults and youth, and to provide policymakers and practitioners with reliable evidence on the effectiveness of social programs. Through this work, and its technical assistance to program administrators, MDRC seeks to enhance the quality of public policies and programs. MDRC actively disseminates the results of its research through its publications and through interchanges with a broad audience of policymakers and practitioners; state, local, and federal officials; program planners and operators; the funding community; educators; scholars; community and national organizations; the media; and the general public.

Over the past two decades — working in partnership with more than forty states, the federal government, scores of communities, and numerous private philanthropies — MDRC has developed and studied more than three dozen promising social policy initiatives.
